Art Unit:

2617

AMENDMENTS TO THE CLAIMS:

This listing of the claims will replace all prior versions, and listings, of the claims in this application.

Listing of Claims:

1. (Currently Amended) A hand-portable device including:

an engine assembly;

a cover for encasing the engine assembly; and

a closing arrangement alterable between a first condition in which it retains at least a part of the cover on the engine assembly and a second condition in which it allows the part of the

cover to be removed from the engine assembly;

the closing arrangement including a polymer actuator which is alterable between a first configuration and a second configuration to alter the closing arrangement between the first and second conditions respectively, wherein the polymer actuator includes an electroactive polymer, the electroactive polymer being a polymer which is capable of converting electrical to mechanical energy, wherein the polymer actuator is bistable, such that voltage <u>is arranged to may</u> be applied to alter the polymer actuator between its first and second configurations, but application of voltage is not necessary to maintain it in either its first or its second configuration.

2. (Canceled).

3. (ORIGINAL) A hand-portable device according to claim 1, wherein the closing

arrangement includes means for altering the configuration of the polymer actuator between the

first configuration and the second configuration by selectively applying a voltage to the polymer

actuator.

4. (ORIGINAL) A hand-portable device according to claim 3, wherein the polymer actuator

includes a conductive polymer.

Art Unit:

2617

5. (Currently Amended) A hand-portable device including:

an engine assembly;

a cover for encasing the engine assembly; and

a closing arrangement alterable between a first condition in which it retains at least a part of the cover on the engine assembly and a second condition in which it allows the part of the cover to be removed from the engine assembly;

the closing arrangement including a polymer actuator which is alterable between a first configuration and a second configuration to alter the closing arrangement between the first and second conditions respectively, wherein the polymer actuator includes an electroactive polymer, the electroactive polymer being a polymer which is capable of converting electrical to mechanical energy, wherein the polymer actuator is bistable, such that voltage is arranged to be applied to alter the polymer actuator between its first and second configurations, but application of voltage is not necessary to maintain it in either its first or its second configurations, wherein the polymer actuator includes a conductive polymer. A hand portable device according to claim 4, wherein the polymer actuator further includes an electrolyte sandwiched between two electrodes, one of the electrodes comprising the conductive polymer.

- 6. (Canceled).
- 7. (Previously Presented) A hand-portable device according to claim 1, wherein the polymer actuator in its first condition mechanically retains the cover on the engine assembly.
- 8. (ORIGINAL) A hand-portable device according to claim 1, wherein the device is configured such that when the closing arrangement is in the second condition, at least a part of the cover is forced out of contact with the engine assembly.
- 9. (ORIGINAL) A hand-portable device according to claim 1, wherein the device includes input means for allowing the input of security information to control the selective alteration of the polymer actuator between the first and second configurations.

10/737,137

Art Unit:

2617

10. (Previously Presented) A hand-portable device according to claim 9, wherein the security

information comprises a code that is one of a numeric, alpha and alphanumeric code.

11. (ORIGINAL) A hand-portable device according to claim 9, wherein the hand portable device

includes a receiver for receiving the security information from a remote source.

12. (Currently Amended) A hand-portable device including:

an engine assembly;

a cover for encasing the engine assembly; and

a closing arrangement alterable between a first condition in which it retains at least a part

of the cover on the engine assembly and a second condition in which it allows the part of the

cover to be removed from the engine assembly;

the closing arrangement including a polymer actuator which is alterable between a first

configuration and a second configuration to alter the closing arrangement between the first and

second conditions respectively, wherein the hand-portable device is configured such that it

becomes partially or completely non-functional if the cover is removed from the engine assembly

in the absence of input of predetermined security information, wherein the polymer actuator is

bistable, such that voltage is arranged to may be applied to alter the polymer actuator between its

first and second configurations, but application of voltage is not necessary to maintain it in either

its first or its second configuration.

13. (ORIGINAL) A hand-portable device according to claim 1, wherein the cover includes at

least two cover parts which are detachable from the engine assembly, the cover being retained on

the engine assembly by attaching the cover parts together to encase the engine assembly or by

attaching each cover part to the engine assembly.

14. (ORIGINAL) A hand-portable device according to claim 1, wherein the cover includes

one cover part which is permanently attached to the engine assembly and one cover part which is

detachable from the engine assembly, the cover being retained on the engine assembly by

attaching the detachable cover part to the other cover part or to the engine assembly.

4

10/737,137

Art Unit:

2617

15. (Currently Amended) A hand-portable device according to claim 13, wherein the closing arrangement is arranged to may selectively retain together first and second closure portions of the hand-portable device, in order to selectively retain the part of cover on the engine assembly, the first closure portion being on one cover part and the second closure portion on the other cover part, or the first closure portion being on one of the cover parts and the second closure portion on

the engine assembly.

16. (ORIGINAL) A hand-portable device according to claim 15, wherein the device is

configured such that when the two closure portions are retained together by the closing

arrangement, a waterproof seal is formed between the closure portions.

17. (Currently Amended) A hand-portable device according to claim 15, wherein the polymer

actuator is located in one of the closure portions, and the other closure portion is shaped to define

a recess into which the polymer actuator is adapted to may extend when in its first condition, to

retain the two closure portions together and thereby retain the cover on the engine assembly.

18. (ORIGINAL) A hand-portable device according to claim 17, wherein each cover part of the

hand-portable device includes a body portion for covering a back or front of the engine assembly

and a perimeter portion, the respective perimeter portions contacting one another when the cover

encases the engine assembly, the perimeter portions of the cover parts comprising the closure

portions.

19. (Currently Amended) A hand-portable device including:

an engine assembly;

a cover for encasing the engine assembly; and

a closing arrangement alterable between a first condition in which it retains at least a part

of the cover on the engine assembly and a second condition in which it allows the part of the

cover to be removed from the engine assembly;

the closing arrangement including a polymer actuator which is alterable between a first

5

Serial No.: 10/737,137 Art Unit: 2617

configuration and a second configuration to alter the closing arrangement between the first and second conditions respectively, wherein the polymer actuator includes an electroactive polymer, the electroactive polymer being a polymer which is capable of converting electrical to mechanical energy, wherein the polymer actuator is bistable, such that voltage is arranged to be applied to alter the polymer actuator between its first and second configurations, but application of voltage is not necessary to maintain it in either its first or its second configuration, wherein the cover includes at least two cover parts which are detachable from the engine assembly, the cover being retained on the engine assembly by attaching the cover parts together to encase the engine assembly or by attaching each cover part to the engine assembly, wherein the closing arrangement is arranged to selectively retain together first and second closure portions of the hand-portable device, in order to selectively retain the part of cover on the engine assembly, the first closure portion being on one cover part and the second closure portion on the other cover part, or the first closure portion being on one of the cover parts and the second closure portion on the engine assembly, wherein the polymer actuator is located in one of the closure portions, and the other closure portion is shaped to define a recess into which the polymer actuator is arranged to extend when in its first condition, to retain the two closure portions together and thereby retain the cover on the engine assembly A hand-portable device according to claim 18, wherein the polymer actuator extends substantially around a the perimeter portion of one cover part and the recess extends substantially around the perimeter portion of the other cover part, the polymer actuator on the one cover part selectively extending into the recess on the other cover part to retain the two cover parts together.

- 20. (ORIGINAL) A hand-portable device according to claim 18, wherein a plurality of discrete polymer actuators are provided around the perimeter portion of one cover part, with complimentary recesses being defined within the other cover part.
- 21. (Currently Amended) A cover part for a hand-portable device according to claim 1, the cover part including a polymer actuator, the configuration of which is arranged to may be altered to alter the condition of the closing arrangement of the hand-portable device.

10/737,137

Art Unit:

2617

22. (Currently Amended) A method of assembly and disassembly of a hand-portable device including an engine assembly, a cover for encasing the engine assembly and a closing arrangement comprising a polymer actuator having a first configuration and a second configuration, the method including altering the configuration of the polymer actuator between the first and second configurations, to alter the closing arrangement between a first condition in which it retains at least a part of the cover on the engine assembly and a second condition in which the part of the cover is adapted to may be removed from the engine assembly, wherein the method includes altering the configuration of the polymer actuator by the selective application of a voltage to the polymer actuator, wherein the polymer actuator is bistable, such that voltage is arranged to may be applied to alter the polymer actuator between its first and second configurations, but application of voltage is not necessary to maintain it in either its first or its second configuration.

23. (Canceled).

- 24. (Previously Presented) A method according to claim 22, wherein the selective application of the voltage is controlled by the input of security information to the hand-portable device.
- 25. (Currently Amended) A method according to claim 23 24, wherein the security information is input via a user input of the hand-portable device.
- 26. (Previously Presented) A method according to claim 24, wherein the security information is input from a remote source that is one of an external device and via a communications network.
- 27. (Previously Presented) A method according to claim 24, wherein the security information is input from a remote source that is one of an external device and via a communications network.
- 28. (Currently Amended) A hand-portable device including an engine assembly and a cover

10/737,137

Art Unit:
